CHAPTER 21

The TOGAF Standard on a Page

This chapter is part of the GOLD reading tour. See Figure 1-1 in Chapter 1, Section 1.3, for alternative reading tours.

The TOGAF Standard comprises several key components (or concepts), which are detailed in previous chapters of this book. These include the Governance Framework, Architecture Repository, Architecture Development Method, Enterprise Metamodel, and Content Framework. These components are closely linked and form the foundation of the TOGAF Standard together. These components enable the structured development of architecture while maintaining mutual dependencies. Visualizing these components reveals how structured and well-thought-out the framework is.

21.1 Connecting the Concepts

Bringing together the basic concepts mentioned in the introduction and relating them to each other in a visualization clarifies the connection

between these concepts. Figure 21-1 illustrates the relationships between the most important components and aspects of the framework[1].

1. **Enterprise Metamodel Is Created During Execution of the ADM:** During the Preliminary Phase, a tailored Enterprise Metamodel is developed. This model contains all entities relevant to the organization.

2. **Enterprise Metamodel Specifies Entities to Be Used As Building Blocks:** The entities identified in the tailored metamodel serve as the foundation for the creation of building blocks.

3. **Enterprise Metamodel Realizes the Content Framework:** The metamodel also serves as the foundation for the Content Framework, which also needs to be adapted. The Content Framework contains a collection of models representing the architecture. The Content Framework's categorization mechanism can be used to structure a representation of the Enterprise Metamodel, which provides a detailed view of the entities used within an organization.

4. **Content Framework Complements the ADM:** When applying the Architecture Development Method, it may be necessary to add new artifacts to define the architecture more clearly. This could lead to changes (additions or deletions) in certain parts of the Content Framework.

[1] Figure 21-1 can be downloaded in a large format from https://eawheel.com/books/media/

5. **ADM Develops Content for Architecture Domains:** The architecture is developed for the four core architecture domains during the execution of phases B, C, and D of the Architecture Development Method.

6. **Architecture Domains Need Corresponding Architecture Roles:** To properly develop architecture, it is best to create a specialist role for each domain. This role is the Segment Architect.

7. **Governance Framework Governs Architecture Roles:** The various architecture roles within an organization are governed by a central Architecture Governance Framework.

8. **Governance Framework Enables the Use of the ADM:** The Architecture Repository is part of the Governance Framework. This repository contains the processes necessary for implementing architecture activities.

9. **Governance Framework Enables the Architecture Repository:** An important aspect of architecture work is creating artifacts and deliverables, which are stored in the Architecture Repository. The Governance Framework oversees management of the repository.

10. **Architecture Repository Stores Artifacts and Building Blocks:** The developed artifacts and reusable building blocks are stored in the Architecture Repository.

11. **Architecture Repository Contains the Enterprise Metamodel:** The metamodel that was previously created and tailored is also stored in the Architecture Repository.

12. **Artifacts Are Created Out of Building Blocks:** Artifacts use reusable building blocks.

13. **Building Blocks Are Used to Create Catalogs, Diagrams, Maps, and Matrices:** Catalogs, diagrams, maps, and matrices are created using reusable building blocks from the Architecture Repository.

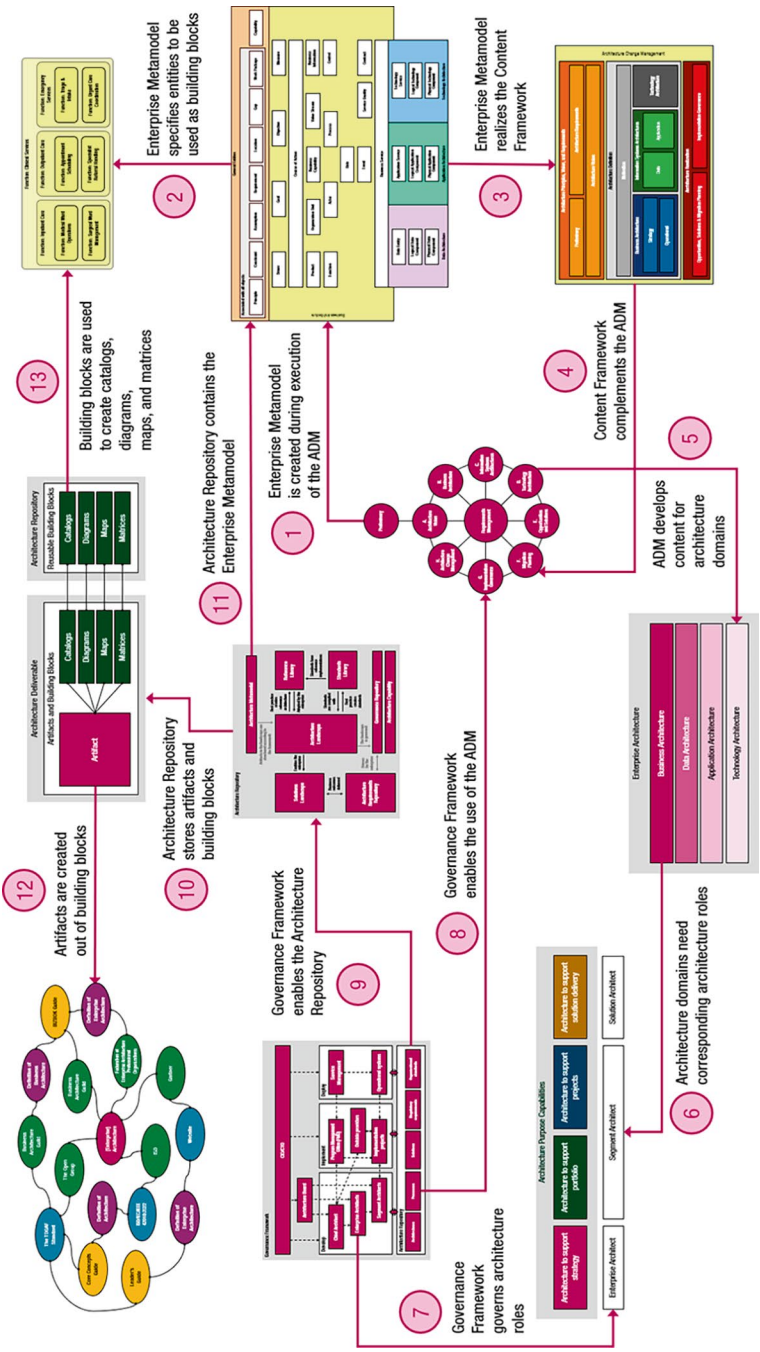

Figure 21-1. *The TOGAF Standard on a page*

As discussed in previous chapters, the TOGAF Standard is much more complex than shown in Figure 21-1. Nevertheless, the visualization provides a good overview of the interrelationships between several essential concepts of the framework. In any case, it clearly shows that the TOGAF Standard is not a random collection of components but rather the result of careful design and consideration, making it the world's leading Enterprise Architecture framework.
