Mastering the TOGAF Standard: Compiled Study Guide

Chapters 1-12 summarized and connected, with a preview of Chapters 13-22 – based on Eric Jager (2025)

How to Use This Guide

This is a condensed, connected study guide for *Mastering the TOGAF® Standard: A Practical Translation* by Eric Jager (2025). The detailed per-chapter guides cover each chapter in depth. This guide shows **how the chapters fit together**: what each one is about, which concepts recur, and how each chapter prepares you for the next.

- **Scope:** Chapters 1-12 (the chapters in the segmented reading folder) are summarized in full. Chapters 13-22 appear only as a **preview**, based on their titles in Figure 1-1 and on the cross-references Chapters 1-12 make to them.
- **Chapter 2 caveat:** the segmented Chapter 2 file covers only pp. 13-15 of a chapter that runs to p. 30, so its summary is partial.
- **Suggested use:** read the mind map and the progression map first, then each chapter summary, then the concept threads. Finish with the integrated self-check.

The Book at a Glance

The book has **22 chapters in 9 parts**, with four **reading tours** (Figure 1-1, p. 11): **Pink** = the very basics; **Green** = the major concepts; **Blue** = the details; **Gold** = content you won't easily find elsewhere. Jager recommends that readers new to TOGAF read the book cover to cover.

Part	Chapter	Pages	Reading tours	This guide
1. Introduction & Basic Information	1 Introduction	1-12	Pink	Summarized
	2 Preliminary Notes	13-30	Pink, Gold	Partial (pp. 13-15)
2. Framework & Definitions	3 The TOGAF Standard	31-52	Pink, Green	Summarized
	4 Architecture Definition	53-62	Pink, Green	Summarized
3. Core Concepts, Governance & Capability	5 Enterprise Metamodel	63-110	Green, Blue, Gold	Summarized
	6 Content Framework	111-126	Green, Gold	Summarized
	7 Architecture Repository	127-187	Green	Summarized
	8 Architecture Governance	189-227	Green	Summarized
	9 Architecture Capability	229-245	Green, Gold	Summarized
4. Roles, Skills & Domains	10 Roles, Skills, and Competencies	247-278	Green, Gold	Summarized
	11 Architecture Domains	279-294	Pink, Green	Summarized
5. Architecture Development Method	12 Architecture Development Method	295-560	Pink, Green, Blue	Summarized
	13 Applying the ADM	—	Green, Blue	Preview

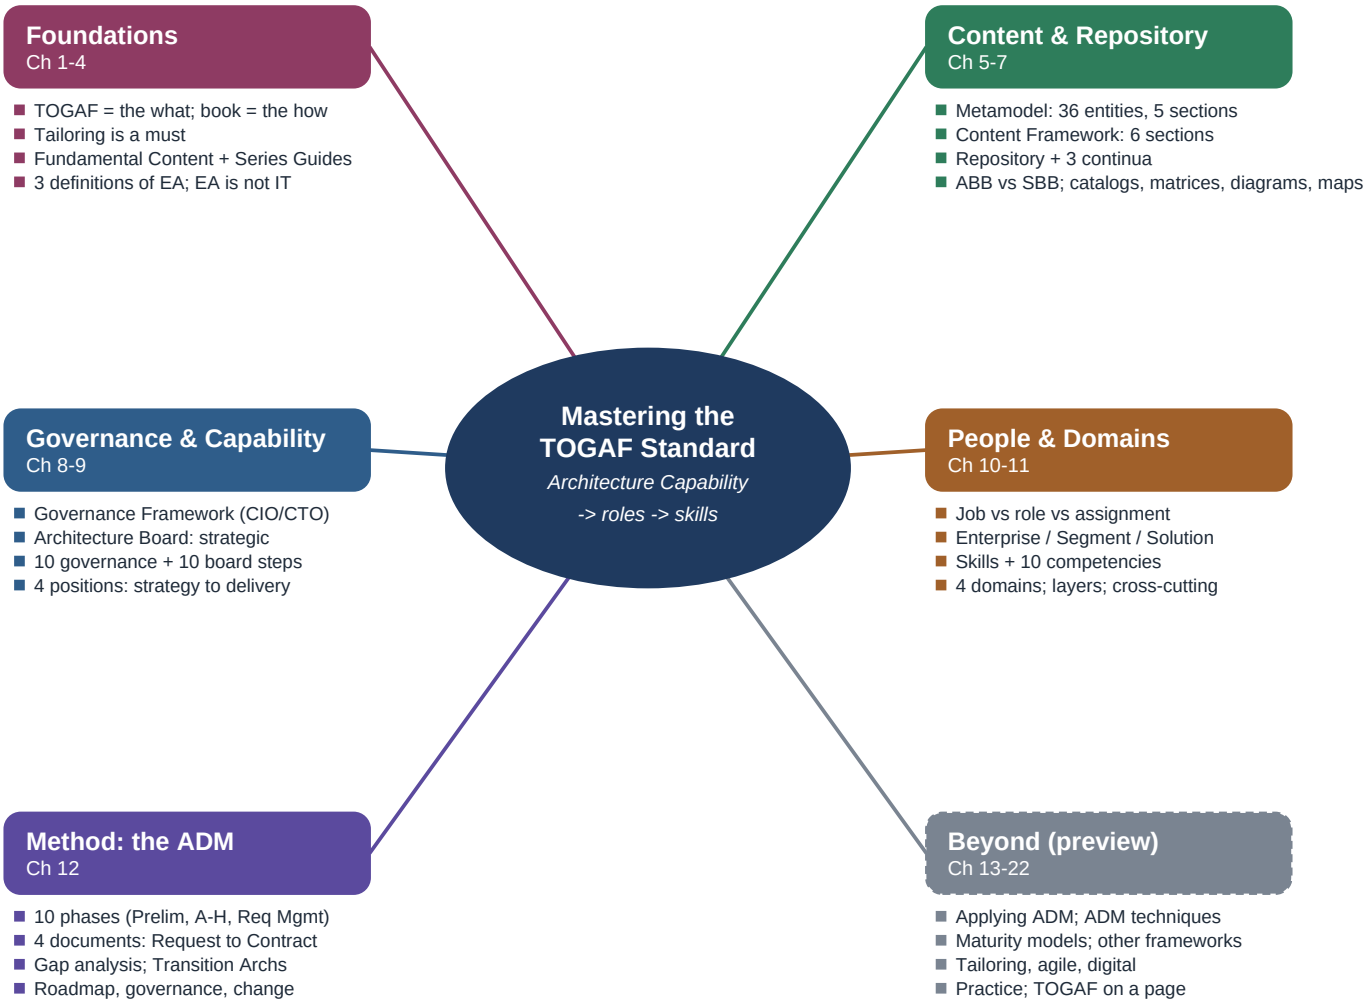
Part	Chapter	Pages	Reading tours	This guide
	14 ADM Techniques	—	Green, Blue	Preview
6. Maturity & Alignment	15 Architecture Maturity Models	—	Gold	Preview
	16 Alignment with Other Frameworks	—	Blue	Preview
7. Tailoring, Specializations & Scenarios	17 Tailoring the TOGAF Standard	—	Green, Blue, Gold	Preview
	18 Agile Architecture	—	Blue	Preview
	19 Digital Transformation	—	Blue	Preview
8. Practice & Coherence	20 Putting the TOGAF Standard into Practice	—	Green, Gold	Preview
	21 The TOGAF Standard on a Page	—	Gold	Preview
9. The End	22 Closing Remarks	—	Pink	Preview

TOGAF in a nutshell (the book's thesis)

- **What TOGAF boils down to (Ch. 1, p. 4):** establishing and implementing the **Architecture Capability**, carried out by **architecture roles** that use **skills and competencies**. Chapters 9, 10, and 12 follow this chain.
- **The four-stage storyline (Ch. 1):** understand business needs, design the architecture, plan the implementation, then govern and execute. This mirrors the ADM: A/B for needs, B-D for design, E/F for planning, G/H for governance.
- **The book's purpose:** TOGAF describes the *what*. Jager adds the *how*: steps, examples, and opinions.
- **The constant refrain:** *tailoring is a must*. Use only what adds value.

Mind Map: The Book's Big Themes

The book's core idea is in the centre. Each branch is a group of chapters with the main ideas you should be able to recall. A dashed branch is preview-only.



Progression Map: How Each Chapter Prepares You for the Next

Read top to bottom. The grey arrows are the main reading order, and the italic note beside each box says what that chapter takes from the one before it. Coloured lanes on the left show the four most important **long jumps** into Chapter 12, where earlier concepts are applied in the ADM. Dashed boxes are previews.

Coloured lanes: Ch 5 -> Ch 12: metamodel tailored in the Preliminary Phase; its entities populate every artifact | Ch 7 -> Ch 12: Table 7-4 artifacts per phase; ABBs refined into SBBs in Phases A-E | Ch 8 -> Ch 12: the governance framework is applied in Phase G (and Phase H) | Ch 9 -> Ch 12: the Preliminary Phase determines and establishes the Architecture Capability.

Chapter Summaries (Chapters 1-12)

Each summary gives the core idea, the concepts to know, what the chapter builds on, and what it prepares you for. Page numbers follow the book's printed pages.

Chapter 1 – Introduction (pp. 1-12)

Core idea: TOGAF is the world's leading EA framework, but it is underused because it explains the *what* and not the *how*. The book translates it into practical steps.

- Three common criticisms: no practical examples; vague guidance on adapting the ADM; "study TOGAF and then do something else instead." Jager calls them mostly unfounded.
- The TOGAF Standard, 10th Edition (April 2022) is split into **Fundamental Content** (stable, and the book's focus) and **Series Guides** (fast-evolving).
- In a nutshell, TOGAF is the Architecture Capability, delivered by roles using skills and competencies. **Tailoring is a must.**
- Reading tours: Pink, Green, Blue, Gold. 22 chapters in 9 parts.

Prepares you for: Ch. 2 (why TOGAF looks the way it does), Ch. 3 (Fundamental Content and Series Guides), and Chs. 9-10 (capability and roles).

Chapter 2 – Preliminary Notes (pp. 13-30; segment covers pp. 13-15)

Core idea: understanding TOGAF requires knowing its history.

- EA emerged informally in the 1960s-70s. The term and the **Zachman Framework** (1987, which Jager describes as really an ontology) appeared in the 1980s.
- **TOGAF was introduced by The Open Group in 1995.**
- EA became a strategic management discipline in the 2000s. In the 2010s it aligned with business process management, data management, and security, driven by digital transformation, cloud, and agile.

Builds on: Ch. 1. **Prepares you for:** Ch. 3 (the current shape of the Standard) and Ch. 11 (domain history: TOGAF 7 to TOGAF 8).

Chapter 3 – The TOGAF Standard (pp. 31-52)

Core idea: the structure of the 10th Edition. Its open, vendor-neutral content is organized like an organization's own Architecture Capability.

- The **six Fundamental Content documents:** Introduction and Core Concepts; ADM; ADM Techniques; Applying the ADM; Architecture Content; EA Capability and Governance.
- The ADM is "the heart" (detailed in Ch. 12). Building blocks are not the same as artifacts (Ch. 7). The four domains are Business, Data, Application, Technology (Ch. 11).
- Series Guides and the TOGAF Library (Reference Library with six categories). The word "Fundamental Content" is used in two senses, which is a trap.
- Seven advantages of TOGAF, including adaptability and tailoring, and a common language.

Prepares you for: almost everything. Each Fundamental Content document has a later chapter: ADM (Ch. 12), Techniques (Ch. 14), Applying (Ch. 13), Content (Chs. 5-7), Capability and Governance (Chs. 8-9).

Chapter 4 – Architecture Definition (pp. 53-62)

Core idea: there is no single definition of EA. TOGAF itself uses three (ISO/IEC/IEEE 42010:2022, Gartner via the Leader's Guide, BIZBOK/FEAPO), so organizations must define EA for themselves.

- **EA is not IT Architecture.** EA is a strategic business management tool with “nothing technical” about it. It coordinates all domains.
- In TOGAF, “system” can mean the whole enterprise, not just IT.
- The primary TOGAF definition lacks a link to business goals. The BIZBOK definition includes strategy execution.

Prepares you for: Ch. 8 (boards should be strategic, not IT), Ch. 9 (positioning and reporting line), Ch. 10 (architecture wrongly placed in IT), and Ch. 11 (EA covers all four domains).

Chapter 5 – Enterprise Metamodel (pp. 63-110)

Core idea: the metamodel defines the **entity types** used to describe an enterprise. It is the vocabulary behind every artifact.

- **36 entities** in five sections: General (8), Business (19), Data (3), Application (3), Technology (3).
- Key distinctions: capability vs. business capability; value stream vs. process; function vs. process; actor vs. organization unit. Measures are KPIs, metrics, and target values. Goals and objectives are SMART.
- Data, Application, and Technology each follow the pattern service, logical component, physical component.
- Jager says it lacks a **stakeholder** entity (among others). Tailoring has five steps: understand, customize, integrate, align deliverables, evolve.
- The **triangle**: metamodel, Content Framework, ADM.

Prepares you for: Ch. 6 (entities categorized), Ch. 7 (entities inside building blocks), and Ch. 12 (the “used entities” column of every artifact table; the metamodel is tailored in the Preliminary Phase).

Chapter 6 – Content Framework (pp. 111-126)

Core idea: the Content Framework is a **categorization framework** that structures architecture work products and maps them to ADM phases.

- The ADM has 8 phases, preceded by the Preliminary Phase. Requirements Management is continuous.
- Six sections: Principles/Vision/Motivation/Requirements (Preliminary/A); Business (B); Information Systems (C); Technology (D); Architecture Realization (E-G); Architecture Change Management (H).
- The Extended Content Framework maps entities to phases. The Motivation section is a known inconsistency.
- Jager adds the Work Package Portfolio Map, because the work package entity is otherwise used only in the Project Context Diagram.

Prepares you for: Ch. 7 (where content is stored and what artifacts exist) and Ch. 12 (the phases these sections map to; the Work Package Portfolio Map in Phase E).

Chapter 7 – Architecture Repository (pp. 127-187)

Core idea: the repository is an **intangible concept, not a tool**, holding reusable building blocks, the metamodel, and governance information.

- Partitions: Architecture Metamodel; Architecture Landscape (Strategic, Segment, and Capability levels); Solutions Landscape; Requirements Repository; Reference Library; Standards Library; Governance Repository; Architecture Capability.
- Three continua: Enterprise (umbrella), Architecture, Solutions. Each runs Foundation, Common Systems, Industry, Organization-Specific.
- A deliverable contains artifacts, artifacts contain building blocks, and building blocks contain entities. Artifacts are catalogs, matrices, diagrams, and maps. **ABB** = what and why. **SBB** = how, product-aware.
- View vs. viewpoint. Choosing a tool (Table 7-5).

Prepares you for: Ch. 8 (Governance Repository and Architecture Board), Ch. 9 (Architecture Capability partition), and Ch. 12 (Table 7-4 artifacts per phase; ABBs become SBBs; the Requirements Repository).

Chapter 8 – Architecture Governance (pp. 189-227)

Core idea: governance controls and manages the architecture and the Architecture Capability. The **Architecture Board** must be strategic.

- Governance Framework: the CIO/CTO directs the Architecture Board and the development, implementation, and deployment capabilities. All of them use the repository.
- Ten steps to implement governance (framework, roles via **RACI**, policies, compliance, reviews, KPIs, ADM integration, communications, automation, improvement).
- Board: not a group of architects. Four or five standing members, not more than ten. Triggers for creating one. Strategic, operational, and governance responsibilities. Ten setup steps. Jager prefers a CEO as sponsor.

Prepares you for: Ch. 9 (the capability being governed), Ch. 10 (the roles in the framework, plus the Domain/Segment naming inconsistency), and Ch. 12 (Phase G applies this; Phase H handles divergence; RACI reappears in the Preliminary Phase).

Chapter 9 – Architecture Capability (pp. 229-245)

Core idea: the capability is the **ability to practice architecture**. It is created like any capability, using the ADM, and it is an **ongoing discipline**.

- Focus areas per ADM phase (Table 9-1), starting in Phase A with an Architecture Maturity Assessment.
- Four positions (Leader's Guide): Support Strategy (CEO, 3-10 years), Support Portfolio (CIO), Support Projects, Support Solution Delivery (unit manager; smallest scope).
- A higher reporting line means more strategic work. A position too close to operations makes architecture reactive.

Prepares you for: Ch. 10 (each position maps to a role) and Ch. 12 (the Preliminary Phase determines and establishes the capability).

Chapter 10 – Roles, Skills, and Competencies (pp. 247-278)

Core idea: the capability is staffed by **three core roles**, each needing specific skills and competencies.

- Job vs. role vs. assignment. Segment Architect is a **job** (formerly Domain Architect).
- Enterprise (with the Chief Architect specialization), Segment, and Solution Architect. Mapping: Strategy to Chief/Enterprise; Portfolio and Projects to Segment; Solution Delivery to Solution.

- Horizontal (domain) vs. vertical (pillar) segments.
- Eight skill categories and four proficiency levels (TOGAF). Ten competencies (Jager), because competency = skills + abilities + knowledge and TOGAF lists none.

Prepares you for: Ch. 11 (role-to-domain scope) and Ch. 12 (the RACI for the EA team; Solution Architects in Phase G).

Chapter 11 – Architecture Domains (pp. 279-294)

Core idea: the four domains, how they differ from layers, and which role covers which domain.

- Business, Data, Application, Technology. Data + Application = Information Systems Architectures.
- TOGAF 7 had Technology only. TOGAF 8 (2002) had Data **or Information**. The Interoperability Model is a healthcare alternative. Data + Context = Information.
- A complete EA covers all four domains. Layers (presentation, business logic, data access, infrastructure) are not domains. Cross-cutting concerns: security, motivation, governance.
- Enterprise covers all domains. Segment covers one domain per specialization. Solution covers mostly Technology.

Prepares you for: Ch. 12, where the domains become Phase B (Business), Phase C (Data + Application), and Phase D (Technology).

Chapter 12 – Architecture Development Method (pp. 295-560)

Core idea: the ADM is the heart of TOGAF. It is iterative, tailorable, and non-prescriptive: it describes what *can* be done.

- **Ten phases:** Preliminary (determine and establish the capability); A Vision; B, C, D (Target plus roadmap components); E (work packages, Transition Architectures, building blocks); F (detailed plan); G (governance); H (change); Requirements Management (continuous).
- **Four documents:** Request for Architecture Work, Statement of Architecture Work, Architecture Definition Document, Architecture Contract.
- B, C, and D share one eight-step pattern centred on Baseline, Target, and **gap analysis**.
- Phase E: Greenfield, Revolutionary, or Evolutionary approach; Quick Wins, Achievable Targets, or Value Chain methodology; the **Architecture Roadmap** linked to SMART goals.
- Phase F: four management frameworks; Business Value and Risk Matrix. Phase G: compliance and progress percentages. Phase H: minor vs. major change. Requirements Catalog.

Builds on: nearly every earlier chapter (see the progression map). **Prepares you for:** Ch. 13 (applying and iterating the ADM), Ch. 14 (the techniques it cites in sections 14.2-14.9), Ch. 15 (maturity models), and Chs. 17-18 (tailoring and agile).

Concept Threads Across Chapters

These concepts appear in several chapters, and each mention adds a layer. Exam questions often test whether you can connect them.

Concept	Introduced	Developed	Applied / extended
Architecture Capability	Ch 1 (TOGAF in a nutshell); Ch 3 (EA Capability & Governance doc)	Ch 6 (3 things to define in Preliminary); Ch 7 (repository partition); Ch 8 (governed by the board)	Ch 9 (create and position); Ch 10 (roles); Ch 12 (Preliminary: determine and establish)
Tailoring	Ch 1 (“a must”); Ch 3 (modular, cherry-pick)	Ch 4 (define EA internally); Ch 5 (5-step metamodel tailoring); Ch 9 (use only the ADM parts you need)	Ch 12 (choose and tailor the framework; non-prescriptive ADM); Ch 17 (preview)
Four domains	Ch 3 (advantage #1)	Ch 5 (metamodel sections); Ch 6 (Content Framework sections); Ch 10 (Segment specializations)	Ch 11 (definitions, history); Ch 12 (Phases B, C, D)
Building blocks & artifacts	Ch 3 (building blocks vs. artifacts)	Ch 6 (artifact types); Ch 7 (ABB/SBB; catalog, matrix, diagram, map; Table 7-4)	Ch 12 (artifacts per phase; ABB to SBB in E; artifacts must contain entities)
Stakeholders	Ch 5 (no stakeholder entity; add one)	Ch 7 (views and viewpoints; Stakeholder Catalog); Ch 8 (governance buy-in)	Ch 12 (Phase A Stakeholder Catalog; stakeholders decide); Ch 14 (preview: stakeholder management)
Governance	Ch 3 (Governance Framework document)	Ch 7 (Governance Repository; Architecture Board); Ch 8 (framework, board, steps)	Ch 11 (cross-cutting concern); Ch 12 (Preliminary sets it up; Phase G applies it; Phase H)
Maturity	Ch 7 (publishing increases maturity)	Ch 8 (board must raise maturity); Ch 9 (maturity assessment in Phase A)	Ch 12 (ACMM/CMMI in Preliminary); Ch 15 (preview)
Segment = Domain Architect / Architecture	Ch 7 (Segment = Domain Architectures)	Ch 8 (Segment Architect, formerly Domain)	Ch 10 (horizontal vs. vertical); Ch 11 (one domain per specialization)
Strategic positioning (CEO vs. CIO/IT)	Ch 4 (EA is not IT)	Ch 8 (CEO-led board); Ch 9 (four positions, reporting line)	Ch 10 (IT-only view shrinks the role); Ch 12 (team composition follows positioning)
Motivation (drivers, goals, objectives)	Ch 5 (entities; SMART)	Ch 6 (Motivation section inconsistency); Ch 11 (cross-cutting concern)	Ch 12 (Driver/Goal/Objective diagram; SMART-linked roadmap; goal progress %)
Work packages & roadmap	Ch 6 (Work Package Portfolio Map suggested)	Ch 7 (Phase E builds via work packages)	Ch 12 (E: roadmap; F: finalized; G: progress tracking)
Requirements	Ch 7 (Architecture Requirements Repository; 3 levels)	Ch 6 (Requirements in the first Content Framework section)	Ch 12 (continuous Requirements Management; Requirements Catalog)

Recurring Author Views to Recognize

Jager often adds personal opinions, marked in the book with special formatting. Exams on *the Standard* won't treat these as TOGAF requirements, but questions on *this book* may ask about them:

- Architecture belongs at the strategic level. The **CEO** should sponsor or lead it (Chs. 4, 8, 9, 10).
- “**Nine out of ten**”: the CIO sits in IT (Ch. 8); boards are made of IT architects (Ch. 8); architecture efforts fail through lack of senior involvement (Ch. 8); Technology Architecture belongs to IT (Chs. 10, 12); Solution

Architects work in the Technology domain (Ch. 11); tools don't separate the Architecture and Solutions Landscapes (Ch. 7).

- TOGAF should add a **stakeholder** entity (Chs. 5, 12) and an explicit list of **competencies** (Ch. 10). **Information Architecture** may return (Chs. 5, 11).
- Some TOGAF “maps” are really diagrams, and some catalogs work better as matrices (Ch. 12). TOGAF has naming inconsistencies (Domain vs. Segment Architect, Chs. 8 and 10).
- He proposes two new artifacts: the **Work Package Portfolio Map** and the **Architecture Roadmap** (Chs. 6, 12).

Preview: Chapters 13-22

These chapters aren't in the segmented folder. What follows comes only from their titles in Figure 1-1 and the forward references in Chapters 1-12, so treat it as a map of where to look, not a summary.

Chapter	What Chapters 1-12 tell us to expect there
13 Applying the ADM	ADM iteration (Section 13.3), the reason the ADM is iterative, not a waterfall (Chs. 3, 12).
14 ADM Techniques	Architecture Principles (14.2.4); Stakeholder Management (14.3), including stakeholder analysis and mapping and the Communications Plan (14.3.3); gap analysis (14.5); Business Transformation Readiness Assessment (14.7); Risk Management (14.8); Architecture Alternatives and Trade-Offs (14.9).
15 Architecture Maturity Models	ACMM (nine elements, including IT security) and CMMI, used in the Preliminary Phase and Phase A (Chs. 11, 12).
16 Alignment with Other Frameworks	Using TOGAF alongside other standards (Ch. 3 lists this as a Reference Library category).
17 Tailoring the TOGAF Standard	Customizing the ADM (Ch. 3), continuing the book-wide tailoring theme.
18 Agile Architecture	The Strategic, Segment, and Capability levels play a role in agile approaches (Ch. 7). Skipping ADM steps is encouraged in agile (Ch. 12).
19 Digital Transformation	A driver of modern EA (Chs. 2, 3).
20-22 Practice, TOGAF on a Page, Closing	Bringing the framework together in practice.

Master Key Facts (Quick Revision)

Topic	Fact to remember
TOGAF origin and edition	The Open Group, 1995. The 10th Edition (April 2022) is the first with “Standard” in the title.
Fundamental Content	6 documents: Intro and Core Concepts; ADM; ADM Techniques; Applying the ADM; Architecture Content; EA Capability and Governance.
Definitions of EA	TOGAF uses three: ISO/IEC/IEEE 42010:2022; Gartner (Leader's Guide, 2008); BIZBOK/FEAPO.
Metamodel	36 entities; 5 sections (8 / 19 / 3 / 3 / 3).
Content Framework	6 sections mapped to ADM phases. Artifacts: catalogs, matrices, diagrams (+ maps in Ch. 7).
Repository levels	Strategic, Segment (= Domain), Capability.

Topic	Fact to remember
Continua	Enterprise (umbrella), Architecture, Solutions; each Foundation, Common Systems, Industry, Organization-Specific.
Building blocks	ABB = what and why (technology-agnostic). SBB = how (product-aware). Deliverable contains artifacts, which contain building blocks, which contain entities.
Architecture Board	Strategic, not technical. Four or five standing members, not more than ten. Triggers: new CIO/CTO, M&A, restructuring, poor strategy execution.
RACI	Responsible does the work; Accountable answers for it; Consulted gives input; Informed is kept updated.
Capability positions	Support Strategy, Portfolio, Projects, Solution Delivery.
Roles	Enterprise (Chief = specialization), Segment (formerly Domain), Solution.
Proficiency levels	Background, Aware, Knowledgeable, Expert.
Domains	Business, Data, Application, Technology. Cross-cutting: security, motivation, governance.
ADM	10 phases. Documents: Request for Architecture Work, Statement of Architecture Work, Architecture Definition Document, Architecture Contract.
Phase E strategy	Greenfield / Revolutionary / Evolutionary. Quick Wins / Achievable Targets / Value Chain.
Phase H	Minor change: update framework or principles. Major change: new Request for Architecture Work.

Integrated Self-Check (Cross-Chapter)

Q: Trace the Architecture Capability from Chapter 1 to Chapter 12.

A: Ch 1 calls it the essence of TOGAF. Ch 3 has a document for it. Ch 6 lists what the Preliminary Phase must define for it. Ch 7 gives it a repository partition. Ch 8 governs it through the board. Ch 9 creates and positions it. Ch 10 staffs it with roles. Ch 12's Preliminary Phase determines and establishes it.

Q: How do the Enterprise Metamodel, Content Framework, and ADM depend on one another?

A: The metamodel supplies the entities. The Content Framework categorizes them and maps them to ADM phases. The ADM tailors the metamodel in the Preliminary Phase and uses its entities in every phase's artifacts (Chs. 5, 6, 12).

Q: Which Chapter 9 positioning option corresponds to which Chapter 10 role and which Chapter 11 domain scope?

A: Support Strategy: Chief/Enterprise Architect, all four domains. Support Portfolio and Projects: Segment Architect, one domain per specialization. Support Solution Delivery: Solution Architect, mostly Technology.

Q: How do Architecture Building Blocks (Ch. 7) evolve during the ADM (Ch. 12)?

A: Candidate ABBs are sketched in Phase A, refined in B-D through Baseline, Target, and gap analysis, and turned into SBBs linked to work packages in Phase E. Their implementation is governed in Phase G.

Q: Where does the Architecture Board (Ch. 8) appear in the ADM (Ch. 12)?

A: The governance framework is set up in the Preliminary Phase. The board approves work and controls implementation in Phase G and recognizes divergence in Phase H. Board sign-off at milestones integrates governance into every phase.

Q: Why does Jager keep arguing that EA is not an IT discipline? Give three chapter examples.

A: Ch 4: EA is strategic with nothing technical about it. Ch 8: boards of IT architects keep the capability reactive. Ch 9: a lower reporting line shrinks scope and makes work reactive. Ch 10: an IT-only view cut his own role.

Q: How do the Chapter 7 repository's Strategic, Segment, and Capability levels relate to Chapters 9 and 10?

A: They mirror the scope of the capability positions and roles: strategy-level work (Chief/Enterprise Architect), segment or portfolio work (Segment Architect), and capability or project work (Segment and Solution Architects). Ch 18 later relates these levels to agile.

Q: Which chapters treat the four domains, and how does each use them?

A: Ch 3 introduces them as an advantage. Ch 5 organizes metamodel entities by them. Ch 6 maps Content Framework sections to them. Ch 10 makes them Segment Architect specializations. Ch 11 defines them. Ch 12 develops them in Phases B-D.

Q: Connect SMART goals across chapters.

A: Ch 5 defines goals and objectives as SMART entities. Ch 8 sets KPI baselines and targets. Ch 12 requires roadmap initiatives to link to SMART goals and computes goal progress from work package percentages.

Q: What single habit does the whole book ask you to adopt, and where does it appear?

A: Tailoring: use only what adds value. Ch 1 (a must), Ch 3 (modular), Ch 4 (define EA internally), Ch 5 (tailor the metamodel), Ch 9 (use only the ADM parts you need), Ch 12 (the ADM is non-prescriptive; tailor the framework), and Ch 17.
