

Chapter 3: The TOGAF Standard

Overview

Chapter 3 (pp. 31-52) introduces the TOGAF Standard, 10th Edition, as an open, vendor- and product-independent Enterprise Architecture framework maintained by The Open Group. It explains the framework's overall structure — the Fundamental Content (six core documents) plus the Series Guides — and shows how that structure mirrors an organization's own Architecture Capability. The chapter then walks through each of the six Fundamental Content documents in detail, introduces the Series Guides and the broader TOGAF Library/Reference Library, and closes with a discussion of the seven key advantages of adopting the TOGAF Standard. This chapter is core exam material because it establishes the vocabulary (Fundamental Content, Series Guides, TOGAF Library, Reference Library, the four architecture domains) used throughout the rest of the book.

Detailed Section Breakdown

Chapter Opening (p. 31)

The chapter opens by noting it belongs to the PINK and GREEN reading tours (see Figure 1-1 in Chapter 1, Section 1.3, for alternative reading tours through the book). It states that the TOGAF Standard, 10th Edition, is the first edition to have the word "Standard" added to its title — a deliberate choice reflecting The Open Group's mission of creating vendor-neutral standards. The framework has carried several subtitles over the years, and this latest addition sends a clear message: this is a standard for Enterprise Architecture. Structurally, the TOGAF Standard consists of about six documents that form the basis of the framework; this set is supplemented by additional guidance in the form of Series Guides. The complete set of core documents, together with the TOGAF Reference Library, together make up the TOGAF Library.

3.1 What Is the TOGAF Standard (pp. 32-36)

The TOGAF Standard is defined as an open Enterprise Architecture framework, developed and maintained by The Open Group (Figure 3-1, p. 32). It describes the generally applicable approach to establishing an Enterprise Architecture and is presented as a series of independent but closely related documents. A highlighted note explains that The Open Group works closely with customers, suppliers of technology products/services, consortia, and other standards organizations to capture, clarify, and integrate current and emerging requirements, establish standards and policies, and share best practices — with the goal of ensuring openness, interoperability, and consensus.

The TOGAF Standard is described as a fundamental, product- and vendor-independent framework applicable to developing almost any type of architecture in almost any context. The TOGAF Library complements this foundational nature by offering a growing portfolio of practical guidance for applying the framework to specific contexts.

A key conceptual point is that the TOGAF Standard's structure reflects the structure of an Architecture Capability within an organization (Figure 3-2, p. 33). In this figure, the TOGAF Reference Material and TOGAF Library sit at the center; inside them are the TOGAF Concepts, shaped by the Core Content of the TOGAF Standard. At the very center is the Architecture Development Method (ADM) — described as the heart of the framework (detailed further in Chapter 12). The ADM is supported and complemented from all sides by Architecture Content, techniques, and practical applications of the method. The Architecture Capability (detailed in Chapter 9) also plays an important role. Part of the TOGAF Library that provides additional guidance is the Series Guides (Section 3.3).

The chapter then explains the business-driver loop: business needs, driven by the marketplace, serve as input to the TOGAF Standard, presenting problems and challenges to be addressed; in turn, the framework produces business solutions and refined business needs, and both the input and output streams feed into the formation and updating of business vision and drivers. Business capabilities are also central: changes in the business or operating model (e.g., a strategy shift) often require new business capabilities, which are represented as capabilities and provide business value.

A worked example illustrates this using digital transformation: the shift from physical video rental stores to a modern streaming service such as Netflix (Figure 3-3, p. 35). Before transformation, the business had the capabilities "Store Management" and "Physical Product Management"; after transformation these become "Bandwidth Management" and "Digital Product Management." The "Contract Management" capability nominally stays the same (dashed line) but its content changes

substantially — from DVD/Blu-ray supplier agreements to movie/series production studio agreements. "Invoice Management" (thick solid line) is largely unchanged by the transformation.

The section closes by noting that the TOGAF Standard supports different architecture styles, can integrate with other standards/frameworks, adapts easily to different verticals/industries and use cases, and is highly scalable. Reduced to its essentials, the TOGAF Standard consists of the TOGAF Fundamental Content and a collection of TOGAF Series Guides that provide practical guidance on applying the framework.

3.2 Fundamental Content (pp. 36-40)

The Fundamental Content comprises six pivotal documents, each covering a distinct aspect of the framework (first listed on p. 36):

1. **Introduction and Core Concepts** — lays the foundational understanding of the TOGAF Standard.
2. **Architecture Development Method (ADM)** — provides a step-by-step approach to developing Enterprise Architecture.
3. **ADM Techniques** — offers tools and methodologies to enhance the ADM process.
4. **Applying the ADM** — guidance on practical implementation of the ADM in various scenarios.
5. **Architecture Content** — defines the artifacts and deliverables within the architecture.
6. **EA Capability and Governance** — focuses on establishing and maintaining effective architectural practices and oversight.

Each document is then explained in more depth (pp. 37-39):

- **Introduction and Core Concepts** (p. 37): primarily consists of concept terms with accompanying explanations, including the definition of Enterprise Architecture and the different architecture domains the TOGAF Standard distinguishes. It briefly explains the ADM (detailed elsewhere), and covers deliverables, artifacts, and building blocks, plus brief mentions of the Enterprise/Architecture/Solutions Continua, the Architecture Repository, and the Content Framework. It introduces topics but defers detailed explanation to other Fundamental Content documents.

- **Architecture Development Method (ADM)** (p. 37): describes the ADM cycle and how to adapt it to architecture issues, including the scope of an architecture problem and the integration of architecture. The ADM is called the heart of the TOGAF Standard — it is flexible, iterative, and adaptable, tailored by integrating TOGAF components with external architectural assets to meet organizational needs.
- **ADM Techniques** (p. 38): a collection of techniques for applying the ADM, including developing general rules/guidelines — i.e., Architecture Principles (cross-referenced to Chapter 14, Section 14.2.4). It also describes Stakeholder Management (gaining support for architecture projects) and Architecture Alternatives and Trade-Offs — a technique for identifying more than one possible target architecture and weighing the pros and cons of each.
- **Applying the ADM** (p. 38): covers how the ADM is tailored to different scenarios — different process styles (e.g., the iterative nature described in Chapter 13, Section 13.3) or specialized architecture types (e.g., Security Architecture). Chapter 13 provides more detail on ADM use cases.
- **Architecture Content** (pp. 38-39): the Architecture Content Framework defines the building blocks and architectural artifacts used to describe the Enterprise Architecture. Building blocks are key elements used to build the architecture, representing core components such as business processes, information concepts, data entities, and application systems. Architectural artifacts are the deliverables produced during ADM phases — catalogs, matrices, diagrams, and maps that describe the architecture. This document also covers the Enterprise, Architecture, and Solutions Continua — classification systems used to categorize architectural assets.
- **EA Capability and Governance** (p. 39): complements the Fundamental Content with the Architecture Capability Framework (organizational structure, roles, and processes needed to establish/operate an effective EA capability) and a Governance Framework (mapping the design of governance of architecture work; serves as an adaptable starting point). A further section, the TOGAF Library (Section 3.4), provides additional guidelines, techniques, and reference material to tailor the standard.

The Fundamental Content overall serves as a comprehensive guide/toolbox for developing, managing, and evolving Enterprise Architecture, promoting IT/business alignment. The documents are deliberately independent so specialized areas can be addressed in isolation — organizations don't have to adopt everything at once and can cherry-pick (e.g., implement the ADM but skip Architecture Capability components). This modularity is particularly useful in two scenarios (pp. 39-40):

- If an organization is just starting with the TOGAF Standard, it makes sense to adopt its concepts gradually — focusing on core areas like the ADM first and exploring other sections later.

- If an architecture framework is already in place, the organization can blend what's already working with parts of the TOGAF Standard to add extra value.

This modular approach lets an organization align the framework with its unique goals without being overwhelmed. Beyond the six core documents, the TOGAF Standard also provides guidance for specific concerns/use cases through the Series Guides.

3.3 Series Guides (pp. 40-43)

The TOGAF Series Guides were developed in response to the need for better guidance on developing useful Enterprise Architecture, since stakeholders want guidance that supports decisions and guides organizational change. The Series Guides cover a wide range of topics: general guidance on setting up an EA Capability, domain-specific material for Business and Security Architecture, and using agile methods/software development. One guide provides an approach to developing EA following the ADM — a companion to the Fundamental Content that brings its concepts and generic constructs to life. Other guides address using the TOGAF Standard in the digital enterprise, emphasizing how to establish/enhance an EA Capability aligned with the organization.

Not all Series Guides are relevant in every situation, but architects planning a TOGAF deployment should be aware of what's available. Series Guides evolve more quickly than the Core Content, responding to emerging industry trends and market demands; this dynamic content is driven by continuous activity within The Open Group Architecture Forum, operating through a streamlined, incremental delivery process.

Examples of areas covered by Series Guide material (pp. 40-41):

- Domain-specific guidance, such as integrating risk and security into an Enterprise Architecture.
- A foundation for understanding and using business models.
- An explanation of business capabilities and how to use them to improve business analysis and planning.
- Details on how business scenarios can develop resonant business requirements and support the organization in achieving its business goals.

Additionally, the Series Guides describe how to apply the ADM in an agile delivery environment — breaking an architecture development project into small time-boxed increments and applying common agile techniques (cross-referenced to Chapter 18). They also provide reference models, techniques for assessing/quantifying an organization's EA maturity, and documents on using project management techniques to manage EA development.

A Further Reading box (p. 42) notes: the full TOGAF Standard is available online at no additional cost (requires a free Open Group account) at pubs.opengroup.org/togaf-standard/; the complete set of Series Guides is listed at opengroup.org/library/guides/togaf/togaf-series-guides; and The Open Group Architecture Forum can be accessed at opengroup.org/architecture-forum.

3.4 The TOGAF Library (pp. 43-46)

Accompanying the TOGAF Standard is the TOGAF Library — a broad portfolio of guidance material supporting the practical application of the TOGAF approach. It contains guidelines, templates, patterns, and other reference material to accelerate the creation of new architectures. The TOGAF Documentation Set (Figure 3-4, p. 43) is part of the TOGAF Library, which is itself part of the broader Open Group Library (containing all kinds of EA-related content).

The TOGAF Library supports one of the classes of information in the Architecture Repository: the Reference Library. The Reference Library provides guidelines, templates, patterns, and other reference material that can be leveraged to accelerate creation of new architectures for the enterprise (Figure 3-5, p. 44, illustrates the various reference materials). The TOGAF Library follows a categorization model based on capabilities and features delivered through different sets of documents/resources, organized into six categories:

7. **Fundamental Content** (p. 44) — this category of the *TOGAF Library* (distinct from the six Fundamental Content documents of Section 3.2!) contains Series Guides related to the TOGAF Standard. Examples: Business Intelligence & Analytics; Metadata Management; Business Capability Planning; Applying the TOGAF ADM using Agile Sprints.
8. **Guidance to Support Different Architecture Styles and Methodologies** (pp. 44-45) — covers architecture project management, establishing/evolving an EA Capability, and using TOGAF to define/govern Microservices Architecture (MSA). Examples: The TOGAF Leader's Guide to Establishing and Evolving an EA Capability; Microservices Architecture (MSA).
9. **Support for Architecture Areas/Domains** (p. 45) — valuable information on sustainable information systems, architecture maturity models, and business models. Examples:

Environmentally Sustainable Information Systems; Architecture Maturity Models; Business Models.

10. **Support for the Standard Used with Other Standards and Frameworks** (p. 45) — e.g., guidance on using the Architecture Content Framework with the ArchiMate standard, and a guide on integrating the TOGAF Standard with SABSA.
11. **Application in Specific Verticals or Use Cases** (p. 45) — one of the smaller categories; notable example is the "Cloud Ecosystem Reference Model."
12. **Practical Application** (p. 45) — e.g., the "Template Deliverables" document set, containing templates for performing a Capability Assessment, drafting a Communications Plan, or creating an Architecture Roadmap.

All of this content can be downloaded from the TOGAF Library at no additional cost. A Further Reading box (p. 46) points to the TOGAF Library at opengroup.org/togaf-library and to The Open Group's video library on YouTube (@theopengroup).

3.5 Key Advantages of the TOGAF Standard (pp. 46-50)

This section frames the TOGAF Standard as an essential tool for aligning operations with technological advancement, providing a comprehensive approach to designing, planning, implementing, and governing Enterprise Architectures. Seven key advantages are presented as named subsections:

13. **Comprehensive Coverage of Architectural Domains** (pp. 46-47): the TOGAF Standard addresses four primary architecture domains — Business, Data, Application, and Technology — ensuring all facets of an organization's architecture are considered:
 - ***Business Architecture***: defines business strategy, governance, organization, and key business capabilities, ensuring IT systems support business objectives.
 - ***Data Architecture***: describes the structure of an organization's logical and physical data assets and data management resources, facilitating governance and informed decision-making.
 - ***Application Architecture***: provides a blueprint for individual systems to be deployed, their interactions, and their relationships to core business capabilities.
 - ***Technology Architecture***: details the hardware, software, and network infrastructure required to support important applications.

14. **Adaptability and Tailoring** (pp. 47-48): the framework emphasizes tailorability, encouraging organizations to adapt the ADM to fit specific needs/contexts. The Open Group recommends that the ADM be adapted to meet enterprise needs and support different architecture styles. The ADM is designed to be iterative (Chapter 13, Section 13.3) and customizable (Chapter 17).
15. **Enhanced Business and IT Alignment** (p. 48): the TOGAF Standard provides structured steps to bridge the business/IT gap — e.g., clearly defining business processes and mapping them to other entities to identify redundancies, gaps, and improvement opportunities. Stakeholder engagement (Chapter 14, Section 14.3) ensures both business and IT perspectives are considered.
16. **Facilitation of Digital Transformation** (pp. 48-49): the TOGAF Standard is a critical enabler of digital transformation (Chapter 18). A study by O'Higgins is cited, showing effective Business Architecture practices significantly improve business alignment, efficiency, service delivery, and strategic outcomes. The framework's comprehensive approach lets organizations assess current state, envision a desired future state, and build a roadmap between the two.
17. **Support for Process Innovation** (p. 49): dynamic EA Capabilities positively influence process innovation and business/IT alignment by providing clear understanding of existing processes/systems, supporting development of new processes and optimization of existing ones.
18. **Common Language and Communication** (p. 49): the TOGAF Standard offers a common vocabulary and set of concepts, reducing misunderstandings and ensuring stakeholders share understanding of architectural objectives, processes, and outcomes.
19. **Scalability and Resource Optimization** (pp. 49-50): the framework's modular nature allows it to be applied at various scales — from small projects to organization-wide initiatives — helping avoid ad hoc planning pitfalls and ensuring resources are allocated effectively and risks managed proactively.

The section concludes (p. 50) that the TOGAF Standard is a robust and versatile framework offering comprehensive domain coverage, tailorability, and a structured methodology for aligning business and IT, enabling organizations to navigate complexity and drive digital transformation.

3.6 Summary (pp. 50-52)

The summary restates that the TOGAF Standard describes the generally applicable approach to establishing an Enterprise Architecture — an open, foundational, product- and vendor-independent framework applicable to any type of architecture in virtually any context. It reiterates that the framework consists of the Fundamental Content (six documents) and the Series Guides, and that the structure of the TOGAF Standard reflects the structure/content of an Architecture Capability within an organization. The six Fundamental Content documents are listed again in full (p. 51):

Introduction and Core Concepts; Architecture Development Method (ADM); ADM Techniques; Applying the ADM; Architecture Content; EA Capability and Governance.

This segmentation into independent documents facilitates in-depth exploration of specialized topics. Beyond the foundational texts, the TOGAF Standard extends its utility through the Series Guides, which act as practical companions for nuanced application. The TOGAF Library, an integral part of The Open Group Library, is described as a "treasure trove" of materials supporting customization of the framework to an organization's needs.

The chapter closes (p. 52) by describing the TOGAF Standard as not merely a framework but a living, evolving guide that empowers organizations to craft robust, flexible architectures. Using an architecture framework lets an organization leverage existing standards/methodologies rather than reinventing the wheel — but architecture frameworks, including the TOGAF Standard, must be tailored to the specific needs of an organization; because every organization is unique, tailoring is a necessity rather than an option. By selecting the parts of a framework that add value, an organization can apply the approach/methodology to its own specific situation, ultimately saving time, money, and resources.

Key Terms & Definitions

- **TOGAF Standard** (p. 32) — "an open Enterprise Architecture framework. It is developed and maintained by an organization called The Open Group."
- **The Open Group** (p. 32) — the standards organization that develops/maintains the TOGAF Standard; works with customers, suppliers, consortia, and other standards bodies to capture and integrate requirements and share best practices, ensuring openness, interoperability, and consensus.
- **Architecture Capability** (p. 33) — the organizational capability whose structure the TOGAF Standard's own structure reflects; detailed further in Chapter 9.
- **Architecture Development Method (ADM)** (p. 33, expanded p. 37) — the "heart" of the TOGAF Standard; a flexible, iterative, adaptable structured approach for crafting and overseeing the lifecycle of an Enterprise Architecture; detailed in Chapter 12.
- **Business Capability** (p. 34) — represents changes in the operational model, providing business value; new capabilities are often needed when the business/operating model changes (e.g., digital transformation).

- **Fundamental Content** (p. 36) — the six pivotal documents forming the core of the TOGAF Standard (Introduction and Core Concepts; ADM; ADM Techniques; Applying the ADM; Architecture Content; EA Capability and Governance).
- **Stakeholder Management** (p. 38) — a discipline described in ADM Techniques used by architects to gain support for their projects.
- **Architecture Alternatives and Trade-Offs** (p. 38) — a technique in ADM Techniques for identifying alternative target architectures and highlighting the pros/cons of each potential solution.
- **Building Blocks** (p. 38) — key elements used to build the Enterprise Architecture, representing core components such as business processes, information concepts, data entities, and application systems.
- **Architectural Artifacts** (p. 39) — the deliverables produced during ADM phases, such as catalogs, matrices, diagrams, and maps that describe the architecture.
- **Enterprise, Architecture, and Solutions Continua** (p. 39) — classification systems used to categorize architectural assets, covered within the Architecture Content document.
- **Architecture Capability Framework** (p. 39) — outlines the organizational structure, roles, and processes needed to establish/operate an effective EA Capability within an organization.
- **Governance Framework** (p. 39) — focused on mapping the design of governance of architecture work; serves as an adaptable starting point.
- **Series Guides** (p. 40) — guidance developed in response to the need for better direction on developing useful Enterprise Architecture; evolve faster than the Core Content, driven by The Open Group Architecture Forum.
- **The Open Group Architecture Forum** (p. 40) — the body whose continuous activities drive the streamlined, incremental delivery of Series Guide content.
- **TOGAF Documentation Set** (p. 43) — part of the TOGAF Library (shown in Figure 3-4).
- **Reference Library** (p. 44) — provides guidelines, templates, patterns, and reference material leveraged to accelerate creation of new architectures; one of the classes of information in the Architecture Repository that the TOGAF Library supports.
- **Business Architecture** (p. 46) — defines the business strategy, governance, organization, and key business capabilities.
- **Data Architecture** (pp. 46-47) — describes the structure of an organization's logical and physical data assets and data management resources.
- **Application Architecture** (p. 47) — a blueprint for individual systems to be deployed, their interactions, and their relationships to core business capabilities.
- **Technology Architecture** (p. 47) — details the hardware, software, and network infrastructure required to support important applications.

Figures & Tables Referenced

- **Figure 3-1. The TOGAF Standard** (p. 32) — accompanies the definition of the TOGAF Standard as an open EA framework maintained by The Open Group; visually introduces the framework as a series of independent but closely related documents.
- **Figure 3-2. Structure of the TOGAF Standard** (p. 33) — shows the relationship between the TOGAF Standard and an organization's Architecture Capability, with the ADM at the center surrounded by Architecture Content, techniques, and practical applications; important for understanding how the framework's parts relate to each other.
- **Figure 3-3. Simplified example of changed capabilities after digital transformation** (p. 35) — the video-store-to-Netflix example, showing how Store Management/Physical Product Management become Bandwidth Management/Digital Product Management, while Contract Management changes in substance and Invoice Management stays largely the same; illustrates how business capability maps change under transformation.
- **Figure 3-4. The TOGAF Library** (p. 43) — depicts the TOGAF Documentation Set as part of the TOGAF Library, which itself sits within The Open Group Library; clarifies the nesting of these three concepts.
- **Figure 3-5. The TOGAF Reference Library** (p. 44) — illustrates the various reference materials and the categorization model (six categories) used by the TOGAF Library/Reference Library; key for understanding how Series Guides and other resources are organized.

No tables appear in Chapter 3 (Table 2-1, the TAFIM/TOGAF ADM mapping table, belongs to Chapter 2).

Key Takeaways / Exam Focus Points

- The TOGAF Standard, 10th Edition, is the first edition with the word "Standard" in its title (p. 31).
- The TOGAF Standard = Fundamental Content (six documents) + Series Guides; together with the TOGAF Reference Library they form the TOGAF Library (p. 31, p. 35-36).
- The six Fundamental Content documents, in order: Introduction and Core Concepts; Architecture Development Method (ADM); ADM Techniques; Applying the ADM; Architecture Content; EA Capability and Governance (p. 36, repeated p. 50-51) — likely to be tested as a list/order.

- The ADM is called the "heart" of the TOGAF Standard, detailed further in Chapter 12 (p. 33, p. 37).
- ADM Techniques document covers three named items: general rules/guidelines (Architecture Principles, cross-ref Ch. 14.2.4), Stakeholder Management, and Architecture Alternatives and Trade-Offs (p. 38).
- Building blocks vs. architectural artifacts: building blocks are core components (business processes, information concepts, data entities, application systems); artifacts are deliverables (catalogs, matrices, diagrams, maps) — do not confuse the two (pp. 38-39).
- The TOGAF Standard is deliberately modular/independent so organizations can cherry-pick documents (e.g., adopt the ADM without Architecture Capability components) (p. 39).
- Two flexibility scenarios: (1) new adopters start with core areas like the ADM and expand later; (2) organizations with an existing framework blend it with TOGAF parts (pp. 39-40).
- Series Guides evolve faster than the Core Content and are driven by The Open Group Architecture Forum's incremental delivery process (p. 40).
- Nesting hierarchy: The Open Group Library $\supset$ TOGAF Library $\supset$ (TOGAF Documentation Set + Reference Library) (pp. 43-44).
- Important trap: "Fundamental Content" is used twice with different meanings — the six core TOGAF Standard documents (Section 3.2, p. 36) vs. one of six categories in the TOGAF Library's Reference Library classification model that holds Series Guides (Section 3.4, p. 44). Don't conflate them.
- The TOGAF Library's Reference Library has six categories: Fundamental Content; Guidance to Support Different Architecture Styles and Methodologies; Support for Architecture Areas/Domains; Support for the Standard Used with Other Standards and Frameworks; Application in Specific Verticals or Use Cases; Practical Application (pp. 44-45).
- All TOGAF Library content is downloadable free of charge; the full TOGAF Standard itself is also free online with a registered Open Group account (p. 42, p. 45).
- Four architecture domains: Business, Data, Application, Technology (pp. 46-47) — foundational to "Comprehensive Coverage of Architectural Domains," advantage #1.
- Seven key advantages of the TOGAF Standard, each a named subsection: Comprehensive Coverage of Architectural Domains; Adaptability and Tailoring; Enhanced Business and IT Alignment; Facilitation of Digital Transformation; Support for Process Innovation; Common Language and Communication; Scalability and Resource Optimization (pp. 46-50).
- The ADM is iterative (Ch. 13.3) and customizable (Ch. 17) — cited as evidence for the "Adaptability and Tailoring" advantage (p. 48).
- The chapter's closing message: architecture frameworks, including the TOGAF Standard, must be tailored to the organization — tailoring is a necessity, not an option (p. 52).
- The video-store-to-Netflix example (Figure 3-3) is a memorable, testable illustration of how business capabilities change under digital transformation (p. 35).

Self-Check Questions

Q: What organization develops and maintains the TOGAF Standard, and what is the TOGAF Standard fundamentally described as?

A: The Open Group maintains it; the TOGAF Standard is described as an open Enterprise Architecture framework. (p. 32)

Q: What two main components, taken together, make up the essence of the TOGAF Standard?

A: The TOGAF Fundamental Content and a collection of TOGAF Series Guides that provide practical guidance on applying the framework. (p. 36)

Q: List the six documents that make up the Fundamental Content, in the order presented.

A: Introduction and Core Concepts; Architecture Development Method (ADM); ADM Techniques; Applying the ADM; Architecture Content; EA Capability and Governance. (p. 36)

Q: Which document within the Fundamental Content is described as "the heart of the TOGAF Standard," and in which later chapter is it described in more detail?

A: The Architecture Development Method (ADM); it is described in more detail in Chapter 12. (p. 33, p. 37)

Q: What three techniques/topics does the "ADM Techniques" document cover?

A: General rules and guidelines for the architecture (Architecture Principles), Stakeholder Management, and Architecture Alternatives and Trade-Offs. (p. 38)

Q: What is the difference between "building blocks" and "architectural artifacts" as defined in the Architecture Content document?

A: Building blocks are core components used to build the architecture (e.g., business processes, information concepts, data entities, application systems); architectural artifacts are the deliverables produced during ADM phases (e.g., catalogs, matrices, diagrams, maps). (pp. 38-39)

Q: Name the two frameworks that make up the "EA Capability and Governance" document.

A: The Architecture Capability Framework (organizational structure, roles, and processes for an EA Capability) and the Governance Framework (mapping the design of governance of architecture work). (p. 39)

Q: What drives the evolution of the Series Guides, and how does their pace of change compare to the Core Content?

A: The Series Guides are driven by continuous activity within The Open Group Architecture Forum via a streamlined, incremental delivery process, and they evolve more quickly than the Core Content. (p. 40)

Q: Describe the nesting relationship between The Open Group Library, the TOGAF Library, and the Reference Library.

A: The Open Group Library contains all kinds of EA-related content; the TOGAF Library is part of it; the TOGAF Library in turn supports/contains the Reference Library (one of the classes of information in the Architecture Repository), alongside the TOGAF Documentation Set. (pp. 43-44)

Q: What are the six categories in the TOGAF Library's Reference Library categorization model, and why is one of them a potential source of confusion?

A: Fundamental Content; Guidance to Support Different Architecture Styles and Methodologies; Support for Architecture Areas/Domains; Support for the Standard Used with Other Standards and Frameworks; Application in Specific Verticals or Use Cases; Practical Application. The "Fundamental Content" category here is a different concept from the six core Fundamental Content documents of Section 3.2 — this category instead holds Series Guides such as Business Intelligence & Analytics and Metadata Management. (pp. 44-45)

Q: What are the four primary architecture domains addressed by the TOGAF Standard, cited under the "Comprehensive Coverage of Architectural Domains" advantage?

A: Business Architecture, Data Architecture, Application Architecture, and Technology Architecture. (pp. 46-47)

Q: List the seven key advantages of the TOGAF Standard presented in Section 3.5.

A: Comprehensive Coverage of Architectural Domains; Adaptability and Tailoring; Enhanced Business and IT Alignment; Facilitation of Digital Transformation; Support for Process Innovation; Common Language and Communication; Scalability and Resource Optimization. (pp. 46-50)

Q: In the video-store-to-Netflix digital transformation example, which capability changed the least, and which two "new" capabilities emerged?

A: Invoice Management changed the least; Bandwidth Management and Digital Product Management emerged, replacing Store Management and Physical Product Management. (p. 35)

Q: According to the chapter's closing argument, is tailoring an architecture framework like the TOGAF Standard optional?

A: No — because every organization is unique, tailoring a framework to its specific needs is described as more of a necessity than an option. (p. 52)
