

Scope and Boundaries

The Enterprise

This document concerns all operations and stakeholders of UA&P's CSA - Mentoring Unit. This enterprise was created to manage the university's mentoring program. This is in response to UA&P's initiative to assist in the holistic development of its students. It should be noted that UA&P is one of the few universities to implement such a program and, therefore, may share similar mechanisms with other universities.

Business Catalyst

A new policy has been implemented for A.Y. 2026-27 which requires students to have at least three mentoring sessions per semester. Should the student fail to meet the required session quota, they will be on a "to follow" status, and a mentoring session will be automatically scheduled for them by the end of the semester to meet it. If the student fails to meet the quota for two consecutive semesters, this will impact their eligibility to enrol for the following semester. This is the first time such a policy was implemented—this is an attempt to ensure students participate in the mentoring program, as previous years have shown that not every student participated in it.

The scope and boundaries of the Mentoring Unit are as follows:

Scope

Mentoring Session

The unit is responsible for the facilitation and encouragement of mentoring sessions. This is the prime business operation of the unit, in line with the mentoring program's goals and objectives to facilitate students' holistic development.

Mentoring Session Logging

Mentoring sessions are logged for the unit to monitor if the program is functioning as intended. In previous years, sessions were not mandatory but encouraged. But with the new recent policy implementation, these sessions are now required for all students, leading to the unit now monitor the accuracy of the logged sessions.

Approval of Mentors

The Mentoring unit is responsible for approving the list of mentors from the list of professors provided by each of the university's schools. They assess their eligibility and acceptance to participate in the program. They then forward the approved list to the respective schools.

Out of Scope

Mentor-Mentee Pairing Mechanism

The unit is not responsible for pairing students with a mentor. This is strictly handled by the students' respective schools, and the exact pairing process varies between them. The unit only receives the final pairings at the start of the semester.

Policy Approval Process

The unit can only implement and institutionalize the policies. The approval authority rests with the CSA Executive Director and is finalized by ManCom. These policies must be compliant with the University's own policies and Philippine law.

Mentor Change Approval

The unit is responsible for assessing the validity of the mentor change requests from students. However, they are not responsible for approving the change request. This is handled first by the student's current mentor, followed by the requested mentor, and finally the student's respective school. The school has the final decision on the mentor change and cannot be overturned. The unit only relays the request to the prospective proponents.

Boundaries

Organizational

This interaction strictly focuses on the CSA Mentoring unit's two employees and their direct interfaces. These direct interfaces are each of the school's Mentoring Coordinators, the CSA Executive Director, ManCom, IT Office, Finance Management and Reporting (FMR), HR, and Registrar. Although the unit was once combined with the Office of Guidance and Counseling to form the Office of Guidance and Counseling Management (OGCM), they are now separate entities, where Mentoring focuses on the holistic development of students, while the other focuses on mental health. Furthermore, the processes of the other units and departments within the University are beyond the unit's organizational boundaries.

Geographic

The engagement is limited to only the Pasig campus of UA&P. All activities within this location and not outside fall under this boundary, due to there only being one campus.

Functional

The engagement focuses on the facilitation of mentoring sessions, logging of sessions, and approval of mentors. Processes that involve interfaces other than the two employees are outside this functional boundary, specifically the exact mentor-mentee pairing process, policy approval, and mentor change approval.

Operational

The unit cannot modify the exact mentor-mentee pairing process of each school. Additionally, each process varies between them and is not standardized. Furthermore, the new three-session requirement policy is a given operation that is necessary for students and cannot be modified. The unit can, however, modify the tools they use for monitoring sessions and managing the mentor-mentee database.

Time

The engagement can focus on the three-session requirement policy as it is newly implemented for A.Y. 2026-27. The unit has yet to conclude whether the policy is effective in encouraging students to participate in the mentoring program. Any old policies or processes about the monitoring, logging, and attendance of the mentoring sessions before this academic year will not be addressed but may be considered for potential research.

Stakeholder Map

This section maps out the relationship of each of the stakeholders within and interacting with the Mentoring unit.

Interest Classification

Classification of interested are dependent on the level of power, how much power and authority the stakeholder wields in the engagement, and level of interest, how interested they are in this engagement and proposed changes. Stakeholders with high power and high interest are classified as key players, while those with low interest are to be kept satisfied. Those with low power and low interest need minimal effort to be addressed, while those having high interest must be kept informed. Key players are usually stakeholders that play major roles in the engagement, while those with minimal effort are simple interfaces and have little control over the processes. Stakeholders that must be kept satisfied or kept

informed are in-between in the priority, but must be met accordingly to their classification throughout the engagement.

Using the stakeholder power matrix, we can classify the interests of each of the stakeholders and their priority.

Stakeholder	Power	Interest	Quadrant
<i>Mentoring Unit</i>	High – owns and can adopt policy changes and tools	High – this is their own workflow	Key Player
<i>IT Office</i>	High – built and controls the technical pipeline	High – any changes need to go through them	Key Player
<i>CSA Executive Director</i>	High – approves all CSA-level changes	Low – one level lower from daily operations	Keep Satisfied
<i>ManCom</i>	High – final say on institutional changes	Low – only engages in major changes	Keep Satisfied
<i>School Mentoring Coordinators</i>	Low – has no authority over the unit’s tools	High – directly affected by any changes (confirmations and workload)	Keep Informed
<i>Mentors (faculty + external)</i>	Low – no formal say in process design	High – directly affected by any changes (confirmations and workload)	Keep Informed
<i>Mentees (students)</i>	Low – no formal say in process design	High – directly subjected to the policy	Keep Informed
<i>HR</i>	Low – no formal say in process design	Low – handles only the external mentor contracts	Minimal Effort
<i>FMR</i>	Low – no formal say in process design	Low – handles mentor allowances only	Minimal Effort
<i>Registrar</i>	Low – no formal decision-making power over this engagement	Low – provides the student data	Minimal Effort

Based on the interest and power classifications for each of the stakeholders, the Mentoring Unit and IT Office are key players due to their interactions with one another. Changes in policies and tools will

affect the daily operations of the unit, followed by the modification of the technical pipeline needs the input and control of the IT Office. The CSA Executive Director and ManCom must be kept satisfied, as the changes must be approved by them and are in line with institutional policies. ManCom oversees the final approval if the engagement results in drastic changes. School Mentoring Coordinators, Mentors, and Mentees need to be kept informed as they are directly impacted by the processes and policies. Lastly, HR, FMR, and Registrar will be given minimal effort as the engagement does not encroach on their exact processes—their relationship with the Unit is purely external and the provision of data, with no say in power and interest in the engagement.

Catalog

The stakeholder catalog maps out the key concerns of each of the relevant stakeholders. Proposed diagrams and approaches to mapping out their concerns and processes.

Stakeholder	Key Concern	Classification
<i>Mentoring Unit</i>	Reducing session monitoring burden while ensuring accurate data	Key Player
<i>IT Office</i>	Feasibility and maintainability of any proposed technical system change	Key Player
<i>CSA Executive Director</i>	Institutional-policy compliance and reporting to ManCom	Keep Satisfied
<i>ManCom</i>	Institutional-policy compliance	Keep Satisfied
<i>School Mentoring Coordinators</i>	Minimal disruptions to each of their mentor-mentee pairing processes	Keep Informed
<i>Mentors (faculty + external)</i>	Less burden in session confirmation responsibility	Keep Informed
<i>Mentees (students)</i>	Meeting the required three sessions per semester without excessive friction	Keep Informed
<i>HR</i>	Communication and coordination with external mentors	Minimal Effort
<i>FMR</i>	Paying salaries according to the mentoring sessions	Minimal Effort
<i>Registrar</i>	No key concern within this	Minimal Effort

RACI Matrix

Each person and stakeholder must have clear responsibility for any given activity. This is determined using a RACI (Responsible, Accountable, Consulted, and Informed) Matrix. For this engagement, Students A and B, the Mentoring Unit, the CSA Executive Director, and ManCom fall within the scope of this particular engagement because their roles and responsibilities touch on key areas of the business process of the mentoring program.

Activity	Student A (Organizational Architect)	Student B (Framework and Metamodel Architect)	Mentoring Unit	CSA Executive Director	ManCom
<i>Define boundary and scope statement</i>	R/A	C	C	I	-
<i>Build stakeholder map and RACI</i>	R/A	C	C	I	-
<i>Tailor enterprise metamodel</i>	C	R/A	I	I	-
<i>Tailor content framework</i>	C	R/A	I	I	-
<i>Draft principles catalog</i>	R	R	C	A	I
<i>Draft request for architecture work</i>	R	R	C	A	I
<i>Approve/Ratify preliminary phase deliverables</i>	I	I	C	R	A

Framework Interface Assessment

Based on the initial interview, there are three considerations regarding their current business processes and approval rhythm:

CSA's Governance/Approval Chain

The governance/approval chain of the CSA is an existing framework and cannot be modified. All changes at the CSA-level are to be approved by the Executive Director, while any major or institutional changes must be first approved by them and finalized by ManCom. The average approval time of the Executive Director is approximately two weeks. However, ManCom is subject to internal and external factors of that department. This is the framework that a proposed enterprise architecture must incorporate seamlessly.

Academic Calendar as an Operating-Rhythm Constraint

Mentor-mentee pairings occur at the beginning, and compliance with the required number of mentoring sessions and monitoring must be done by the end of the semester. This is a constraint, as the enterprise architecture must fall within this working timeframe. Any proposed process or solution that encroaches beyond this boundary will not interface accordingly with the unit's own operating rhythm.

No Formal ITIL/Agile/Scrum Methodology

The Mentoring Unit currently does not apply any of the ITIL, Agile, or Scrum methodologies. Work is simply monitored when they can, with little to no form of formal reporting. Each business activity is almost entirely reliant on manual processes—human monitoring is the only way to confirm that data is accurate. Overall, the unit operates informally and does not cause major issues due to the unit's size. A proposed architecture will not force this change but could be proposed.
